Pincode 000000

PINCODE VALIDATION

As we know that in our system or software we need to import any cases then there are two modules available for this. Which are accessible by Supervisor.T these two modules have two – 2 another Sub-menu which are used to import the cases inside system .Let us see that module -

Verification

Case Entry - Template Design and Template Assign

Add New Case - Template Design, Template Assign, import Design and Import Assign

Data Files

Import - Template Design, Template Assign, import Design and Import Assign

Multi Import - Template Design, Template Assign, import Design and Import Assign

These are the two modules where the inside of those Submenu has some condition to move forward for import. Each has its different -2 condition.

Here we put a Validation for Pincode field where if we enter 000000 (0 in six times), then it should show an error to the user and ask for another Pincode. And also with this, if the user enters any random number of Pincode which is not stored in the database then it again shows an error to the user.

So when we applied to test on that we found these files in the script where we give these changes –

In Verification and Data files:

Controller:

User / Home .php -> function import()

User / Home.php -> function importlist()

User / Cases.php -> Verification_edit ()

User / cases.php

During our test case, we also found that –

Case status	Fe Assignment	Fe visited	Error
Close	000000	400023	yes
Close	400023	000000	yes
Open	000000	400023	yes
Open	400023	000000	yes
Close	400023	400023	no
Open	400023	400023	no

And also we got one error during testing of **Data Files -> Import**

Error-----

1.

If (\$assignPincode_present==0)

```
{
    $error [ ] ="Please contact RES Vertical SPOC to update <b>Template design</b> with
        Pincode field containing <b>FE Assignment Pincode</b> checked.";
}
```

Where:-

`$assignPincode_present=0; // Updated for Assign Fe Pincode to be required in template`

Some Points which we get During Validation Testing:

- For this, we need FE Assign Pincode in import design.
- We also need verification type in excel form, so we need to allow verification type too.
- When we FE Assign Pincode 123456 then the error says it is not available at line no 1. Please contact RES Vertical SPOC to update Pin code in Master with Rates.
- After these we found that in Fe Assignment in the template does not have validation for Pincode 000000.
- Now I make that validation for Pincode 000000.

After All This we found :

FE Assignment:

- Case Entry - Validation for FE Assignment working demo: Validation Working
- New Case - Validation for FE Assignment working demo: Validation Working
- Import - Validation for FE Assignment working demo: Validation Working
- Multi Import - Validation for FE Assignment working demo: Validation Working
- Case Verification - Validation working for FE Assignment demo: Validation Working

FE Visited:

- Case Entry - Validation for FE Visited not working demo: Validation Working
- New Case - Validation for FE Visited not working demo: Validation Working
- Import - Validation for FE Visited not working demo: Validation Working
- Multi Import - Validation for FE Visited not working demo: Validation Working
- Case Verification - Validation working for FE Visited demo: Validation Working

When all test and Solution completed then we find a new Bug. Where are all Validation worked properly but in Live Server validation was not working?

We Login in the PAMAC test server and test Debug that error and we found that there are –

if(\$_SESSION['sess_user_country_id']==11 **if(\$_SESSION['sess_user_emp_id']==11**

this was replaced by mistake during any another process. So I just replace it and now when I move back to test again then we got –

- Random Number of pin code Working Properly in Live.
- Pincode 000000 For FE Assign and FE Visited working Properly.

That is the code which is used to apply validation in Pincode:

```

if ($values[$fields['field_name']] == '000000')
{
$success = "n";

$custom_error="<b>". $fields['field_label']. "</b> ". $values[$fields['field_name']]. " is not Valid Pincode.
Please Check your Pincode and then insert";

}

```

```
elseif(!empty($values[$fields['field_name']]))
```

```
{
```
