Manas Dasgupta | Login multiple device

---

Hi Manas,

Please check User cannot login multiple devices.

If already login user try to login another device show error message "user already login"

Hello,

### Process 1:

- 
- 1) User logs in via mobile app.
  - 2) Next we check if user auth is true then we check whether user last login datetime is greater than or equal to the a threshold (recent login) datetime (we decide this datetime for compare) and if comparison fails we update last login datetime again and let the user login. If comparison is successful we stop user from login.

### Example:

```
// Define a threshold for what you consider as "recent" login (e.g., within the last 24 hours)
```

```
$recentLogin = date('Y-m-d H:i:s', strtotime('-48 hours'));
```

```
if ($lastLoginDatetime >= $recentLoginThreshold) { $msg = 'User is already logged in'; }
```

### Process 2:

-----  
1) User logs in via mobile app.

2) We store user id , device id and a session flag, on try to login from another device we check if the session flag is present or not for that user and any device, if present we don't allow user to login else we allow.

But we need to clear this session flag at logout otherwise, user will not be able to login if apk is un-installed from mobile device and installed in another device.

Need to clear this session flag at a certain interval of time either by using cron or using time based session flag. Meaning the session flag will itself have an expire time once set.

Let us know which process will serve the requirement better. Please discuss if any query.

**Note:** Also I think there is no logout functionality in mobile app, also i cannot find any logout functionality in live webservice to capture logout datetime.

But in demo server webservice with old VAPT points logout function is present.

Yes , No logout functionality present in mobile both india and dubai live apk.

First we have to call logout api then check logout and login session flag .
