Case history data Json encode

---

Hello team,

As discussed with Sir Kailash and Shaikh we will make changes in case history to save case details in json encoded form. So that we can access this data later in array format for MIS and other uses.

Hello,

Shaikh and Jayant please check this query which you can use to extract a particular value from a json encoded string saved in case history table.

This can be used in MIS also where you will need then to make join with tbl\_case history.

**Example :**

```
SELECT details->>'$.case_update_query' FROM `tbl_case_history` WHERE case_id='102084172' AND  
JSON_VALID(details)=1 AND JSON_EXTRACT(details, "$.case_update_query") IS NOT NULL
```

Hello,

I have updated the json data for case history table for last 3 months in country demo. Please use above query to test. Also you can use it for your task on MIS related to case history table.

Please confirm if it is working before updating on live server.

Hello team,

Changes for case history , to convert details field value in json are updated in live server also.

Will dump old case history details field value and convert them into json and update on friday night for last 3 months.

As discussed the query size is too long which will slow db if we execute. So will do it when C94 development is put on live.
