(All Members) | Slowness of operations during monthend

Note: Ganesh am assigning this to you as i cannot directly assign to SuperAdmin (and siddharth is not in the list of assignees).

Hi Sidharth

I just thought of putting my views on the subject though I am sure you would have considered the same in your attempt to reduce the slowness of operations due to Mysql using higher CPU/memory.

Please review (in case not already done):

Memory usage settings – buffer sizes – innodb buffer , max connections, query cache size, Available RAM etc.

And lastly - Further, the team has already identified 5 high time consuming queries

Think of optimizing queries and code (these probably will be taken care during upgradation)

I request you to suggest measures to keep the show running till upgradation like:

- a) Having separate databases for Mysql and application
- b) Or having cluster databases (master-master or master-slave) so that the queries run on which ever cluster is free
- c) Fine tuning at least the above 5 queries (if they are one of the culprit in slowness)
- d) Any other suggestion.

I plan to discuss your suggestions and also my views with Pravin on his return. Hence I am planning to discuss with Pravin and attempt to convince him on the future action plan (give him the cost benefit analysis etc.)

Hi Kailash

As discussed in today's weekly call, please share the required details to analyse the load on the monthend

We need to take action on this asap to avoid issue on this monthend.

Hello sir,

As discussed capture log table will be added for following module in both India and Dubai server -

- 1) Export
- 2) Export Excel Report
- 3) Reports
- 4) Custom Reports

Hello sir,

Changes are uploaded in demo and live server both for India and Dubai server:

New log table name is : tbl_case_action_history. Screenshot attached.

Following columns are present -

id : Log table PK,

module : Module names (export, export-excel-report, report, custom-report),

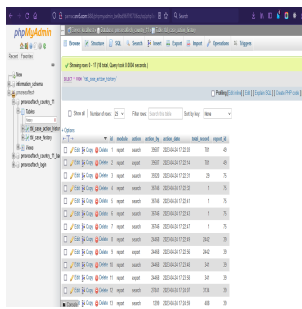

action: search or export ,

action_by: Who performed the action,

action_date: When the action was performed (datetime),

total_record: Total records fetch from table during the action,

report_id: Additional field to store Report id to know which report was used for the action,

↓ Download
