point no. 20

requirement

Moving of cases across centers with Center ID in import

functionality discussed

import template have 3 fields zone, center, subcenter

in main template user have to add 3 fields zone,center and sub-center.

these fields will not be visible in web-form(because they are not editable by any user).

user have to add these 3 fields in import template.

if import template is combine for more than one Verification type then it is compulsory to select zone ,center and subcenter for all verification types in import design.

at the time of import application will check 3 fields, if any one is include but other two are missing then application will show error, not import any case.

priority for adding zone,center and subcenter

1) if zone,center and subcenter is given then check name from their respective masters fetch id and store in case table, if any id not fetch due in wrong name then application will throw error.

if zone exist but center is not in selected zone then also show error.

if center exist but subcenter is not in selected center then also show error.

below is existing functionality (no change)

2) if pincode exists then zone center and subcenter set as per given pincode

3) if pincode empty then set as per selected zone,center and subcenter

4) if zone,center,subcenter not selected then they set NULL

we discuss that all 3 values are compulsory for import.

Is there any such zone which don't have center then system will not import cases for that zone?
Is there any such center which don't have subcenter then system will not import cases for that center.

If import template is combine for more than one Verification type then it is compulsory to select zone ,center and subcenter for all verification types in import design.

- import template will mostly be for more than one VT, the zone, center, sub center mentioned in excel row will be applicable to all the VTs mentioned in that row

Priority will be:

- 1) pincode
- 2) zone, center, sub center given in excel
- 3) zone center sub center selected in import module web page

we discuss that all 3 values are compulsory for import.

Is there any such zone which don't have center then system will not import cases for that zone?

- there is no such zone as of now, but it may be added in future. so if there is a zone in future that does not have a center then the case can be imported in the mentioned zone.

Is there any such center which don't have subcenter then system will not import cases for that center.

- there are centers that do not have sub center, system should allow to import cases there.

Basically, system should check the provided values in descending order with the master like, if sub center mentioned then check whether the center mentioned for it is correct or no, if correct then ok, if not correct then error, if not mentioned then ignore; then center mentioned is for the correct zone or no, if correct then ok, if not correct then error and if not mentioned then ignore (but if sub center is mentioned then center & zone is compulsory; if center mentioned then zone is compulsory).

I have one query on below post :

If import template is combine for more than one Verification type then it is compulsory to select zone ,center and subcenter for all verification types in import design.

- import template will mostly be for more than one VT, the zone, center, sub center mentioned in excel row will be applicable to all the VTs mentioned in that row

**** Import template is a combination of multiple main templates(of different VT's).**

Consider we have designed one import template for VT's RV,BV,RT and BT.

For common values(in import sheet) we give same label and order no to fields,in this case if zone/center/subcenter fields selected only of two templates(RV and BV) and these fields of other two templates not have any label and order then system will put value of these columns in RV and BV's cases only even if values are given in excel and it will not put values in RT and BT's case .

Is it ok?

as discussed on skype, if zone , center, sub center are used in import design for RV & BV and not used for RT & BT. Case is imported for RV+BV+RT+BT, hence as per import template design, RV & BV will be moved as per excel center zone and RT & BT will not be moved as per center zone.

This is ok.

Done with the changes related to this point.

Uploaded it on demo site.

Please verify and confirm.

Changes has been done as per above discussion.

Process is as given below :

1. import template have 3 fields zone, center, subcenter

in main template user have to add 3 fields zone,center and sub-center.

these fields will not be visible in web-form(because they are not editable by any user).

2. at the time of import application will check these fields with its dependent parent value field, if parent value field is missing then system will show error.

Ex. In import sheet only center is given and zone is not given then system will show error.

3. System will consider given values only. There is no compulsion on giving all 3 fields and their values(will show error only if there is dependency).

4. Priority will be:

1) pincode

2) zone, center, sub center given in excel

3) zone center sub center selected in import module web page

5. if zone , center, sub center are used in import design for RV & BV and not used for RT & BT. Case is imported for RV+BV+RT+BT, hence as per import template design, RV & BV will be moved as per excel center zone and RT & BT will not be moved as per center zone.

Date & Time : 12-07-2016 10:52:AM

I have uploaded changes related to this on live site.

For testing existing operation only imported single case of id '102263594'.

Unable to test it with region in given i excelsheet because it need changes in templates.

Please verify the changes and confirm.

Point 20 tested ok on live.

Test case details below for reference:

Client: Test

Product: Home Loan

Activity: CPV

VT: RV & BV

Import file attached.

Import - center testing - live.xls

↓ Download
