Manas Dasgupta | Table optimization

Hello team,

This thread will be used to track table optimization related to Live server.

Following tables found so far which requires optimization for live **India** DB -

1) Database Name : **pmsresoftech_country_11**

tbl_cases (total 687 columns)

tbl_case_history

tbl_mst_employee

tbl_mst_employeeassign

tbl_mst_employeerate

tbl_assign_menu

tbl_assigned_templates

tbl_mst_importtemplateassign

tbl_mst_exporttemplateassign

tbl_mst_pdfexportassign

tbl_fe_assign

tbl_template_export_details

tbl_template_global_meta

tbl_mst_activity_template_fields

2) Database Name : **pmsresoftech_login**

tbl_mst_employee

3) Database Name : **pmsresoftech_country_11_backup**

The screenshot shows the AWS IAM console interface. At the top, the breadcrumb navigation indicates the path: **Groups** > **Groups**. Below this, there's a summary section for the selected group, **aws_managed_group**, showing it has 0 members and 0 permissions. The main table lists five groups, all of which are **aws_managed_group** type. The **aws_managed_group** group is highlighted. The **Details** tab is selected, showing the group's name, type, and other properties. The **Groups** list table is as follows:

Group Name	Type	Members	Permissions	Actions
aws_managed_group	aws_managed_group	0	0	Yes
aws_managed_group_2	aws_managed_group	0	0	Yes
aws_managed_group_3	aws_managed_group	0	0	Yes
aws_managed_group_4	aws_managed_group	0	0	Yes
aws_managed_group_5	aws_managed_group	0	0	Yes

The **Details** tab for **aws_managed_group** shows the following information:

- Name:** aws_managed_group
- Type:** aws_managed_group
- Permissions:** 0
- Actions:** 0
- Tags:** 0
- Permissions Summary:** 0
- Permissions List:** 0
- Tags List:** 0

↓ Download

After

The screenshot shows the AWS IAM console 'Groups' page. The 'Groups' list table is highlighted with a red box. The table has columns: Name, Type, Status, and Permissions. The 'Groups' list shows the 'AWS-ReadOnlyAccess' group with a status of 'Active' and a permissions link. The 'Permissions' link is highlighted with a red box.

Thanks bhavana

Hope this improves the speed on the transactions dependent on these tables.

Please try to do for the other two important tables `tbl_cases` and `tbl_history` as soon as possible

Hello,

Below mentioned pending table names optimization is done, some screenshots attached -

1) tbl cases (both DB)

2) tbl case history

The screenshot shows the RStudio interface with a script editor on the left and a console window on the right. The script editor contains the following R code:

```
# Load packages
library(tidyverse)
library(dplyr)

# Create a data frame
data = data.frame(
  year = 2019,
  month = 1,
  day = 1,
  time = "00:00:00",
  location = "New York",
  status = "Active"
)

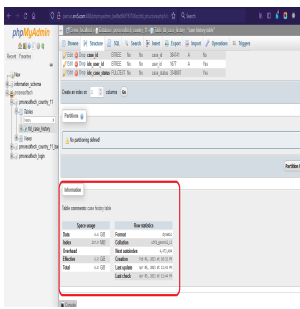

# Summarize the data
summary(data)
```

The console window displays the output of the code, showing the structure of the data frame and the summary statistics for each variable.

```
#> # A tibble: 1 x 6
#>   year month day time location status
#>   <dbl> <dbl> <dbl> <chr>   <chr>   <chr>
#> 1  2019     1     1 00:00:00 New York Active
```

Now that we have done this exercise, don't you think that this should be done periodically (may be once a month or quarter or half year) and if so should we not have a cron job for the same.

Please let me know your views in this regard.

Hello team,

As per last discussion all 3 database tables are optimized for live India server. Some screenshots attached.

Hello team,

After successful test of cron job in demo server, today tested in live India server with script timeout issue, screenshot attached.

Also log file was not created.

Hello,

Please check below URL for reference used to re-index table. We have used the [ALTER TABLE Method. in the cron script.](#)

Ref URL : <https://dev.mysql.com/doc/refman/5.7/en/rebuilding-tables.html>

Hello sir,

As per new changes in table optimization script to drop and add index in all tables in all database, below is attached test result zip. Please check.

The zip contains :

- 1) screenshot of some table index and their size before cron run and after cron run.
- 2) screenshot of optimization script run response. (total 3 times). Got errors 2 times for a table called **tbl_report_search** . 3rd time it was success.
- 3) Log files for optimization script run.
- 4) **tbl_report_search** index before and after. Error was for query : to add KEY `report_id` on column s report_id and range i.e composite index. **Error message** can be seen in both optimization script run response and 1st log file.

Note:

- 1) I have added the index back again for **tbl_report_search** after cron run was completed with success. As such next run it will throw error again.
- 2) The optimization script does not re-index Primary keys.
- 3) Also note as found while searching for re-index for tables with large dataset may crash the table : <https://stackoverflow.com/questions/29377276/add-index-crashes-mysql>
- 4) Must have backup always before running the script, script timeout issue not faced as data is less in demo server

Script File Name used for this test : **cron/OptimizeTables.php**

Hi

From the details given by you it looks like reindexing through cron job is happening. However, i also find that there are many tables which probably do not have an index. Please confirm that these are small tables and probably not used for query / report enquiry etc.

Regarding the large table reindexing, if the same is done in the night 2.00 am + there should normally not be any issue as a) the back up would have been taken by then; 2) there won't be any user at that time or may be only a

couple of them. Hence the cron should run properly.

This cron job can be run once every sunday and is not required every day. This also would reduce the risk of failure.

Let us give it a try in production for one day and check the performance after the backup is taken.

please also confirm to whom does the email on success or failure go.

Is Ganesh included in the list. If not please include ganesh as recipient of email of success or failure.

Hello sir,

1) Before scheduling cron for live server need to check and resolve the add index issue as found for table **tbl_report_search** . Need to find the purpose of the table and its composite index where it fails. Please check above attached zip file for more details on error message, it can be found in cron Screenshots Cron folder.

2) For email logic, it is kept disabled for now. Since script can take more time to execute if activated to send the email.

We will check log files as it will be more detailed and remove the email function.

Log Path: /image_del_log/cron_table_reindex

File Name example: table-reindex-log_2023-08-09.txt

3) Yes as found in log some tables have only Primary key as index no secondary indexes. Use of each of the table will take time to identify in code, which we will do in the next process as discussed with Shimbi team.

Hi manas

point 1 Ok - get the error identified and do the needful.

Point 2 - OK - but email at tend giving one line message success or failure would be helpful Just check the possibility without hampering the performance of the cron job.

Point 3 OK - Keep this in mind during your upgradation process - you can mention this in D266.
