Dipika Yedge | Changes in background sevices (FCM)

Hi,
As discussed,
Currently for removing cases from RES application we use webservice function which called Background service. But due to limitation of Background Process we want to change the flow of removing case from application.

There will be 3 parameters for removing cases from application

1) At the time of Send To Client.

2) At the time of Case assign to another FE

3) At the time case is soft deleted from Backend user.

On above three trigger we will send message to FCM server accordingly to respective user's token.

1) At the time of Send To client

= When case done send to client and if fe_id is available the send Message to FE's token

2) At the time of Case assigning or re-assigning

=   Case assigning= After case importing case we assigned to case FE then send Message to Fe's token
= Case Re-assigning= Case is assigned and now Back-end wants to case assign to another FE then
   i) Send assign to other FE instruction(Message) to existing FE.
   ii) Send assigning instruction(Message) to new FE.

3) Soft Delete

When case is stored in FE's device and Case is deleted by Backend User(Supervisor) then send Delete instruction to FE's token

hi,

Push notification done using FCM from android app side,

When a user login in a new token id will be created ,
That token id we will send to the server side ,with help of token id from server side send message to user.

 need to implement from server side also.

Hi,

Please check Task Priority from Task list an discuss if any. Also let me know what is to be done here after login of Fe from mobile and what message will be send to which user.

hi,

After sending message from firbase cloud server ,will get notification on mobile.

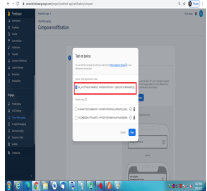

f

⤓ Download

as per screenshot we are creating token id from app side

⤓ Download

In firebase console creating message like case moved,remove for notification

⤓ Download

added token id which is got from app side and send

Ok. I think task is added to Task list and as per that we can start working on it.

Till then you can complete the push notification end point URL's coding in mobile app that will be used from web to trigger the following events :

 1) At the time of Send To client
= When case done send to client and if fe_id is available the send Message to FE's token

 2) At the time of Case assigning or re-assigning
=   Case assigning= After case importing case we assigned to case FE then send Message to Fe's token
 = Case Re-assigning= Case is assigned and now Back-end wants to case assign to another FE then
    i) Send assign to other FE instruction(Message) to existing FE.
   ii) Send assigning instruction(Message) to new FE.

3) Soft Delete
 When case is stored in FE's device and Case is deleted by Backend User(Supervisor) then send Delete instruction to FE's token
