(All Members) | Details of the snapshot

Hi Siddharth Sir

We are in discussion with our internal team on the external backup solutions however we would like to know what all things covered under the snapshot/ (for e.g. C drive and application and database)

✎
Hi siddharth ji

This question of snapshot keeps coming up in many discussions in our HO.

I have a few specific queries:

- We have i think AWS LS and we have taken a separate snapshot service from AWS (for some 7 K/pm).
- The AWS LS is probably a VM - please confirm
- Now if the snapshot is being taken as at a particular time (time to be known) every day - does it include database (Mysql) and all the folders and files in the server or is it only database?
- In case of AWS VM failure (database & application lying therein), who would restore the server - is it us or AWS team and if us do we have the process in place (duly documented so that this activity is not fully person dependent).
- Since the snapshot is as of a specific time, we have to keep all stakeholders informed that in such cases, the any new data from the time snapshot was taken to the time of actual failure would be lost and will have to be keyed in again (or uploaded with some limitation).

- An early response would help us in studying ACRONIS for normal backup and check whether that can be used for restoration on AWS (which i doubt).
